

To [Gerard Roudier <groudier@free.fr>](mailto:Gerard.Roudier@groudier@free.fr)

Matthew Wilcox <matthew@wil.cx>

Hi,

I have a massive problem with the sym53c8xx V2 driver. I have tried a actual version of Debian Sarge and now I changed to Gentoo 2005. Both Distributions have an actual 2.6 Kernel and the same problem. I have also searched in the Internet and it seems there are even much more people with similar problems – with different controllers, different chipsets and different drives. So I thought it might be a good idea to inform you about the problem and ask for an solution. I have also informed Gentoo via a bug report. So fart no solution was found. A little Patch was not helpfull at all. Similar Bugreports can be found at red-hat and in the kernel bugtracker.

When booting, the System goes into an kind of reset loop for the SCSI-Bus. After a while, in an kind of accident (I was beginning to cook while linux boots) I found my system continuing the boot-process, but I'm not sure if the scsi subsystem now works. My problem is, that /proc/modules is empty and so lsmod does not show any modules loaded. My fstab points to my three scsi cdrom drives and to the swapdisc. Gentoo is not able to access these mountpoints and so displaying errors when trying to interpret the fstab. So I think scsi does not work at all.

Well most hardware support I have compiled into the kernel but showing no modules at all is a bit scary to me. So my actual stand is, that I found out, that the System continues the boot-process after a few minutes but this only work, I think, because the system partition is located on an IDE harddrive and the SCSI Subsystem only provides the CD-ROM's, (fast) Datadrives and the Swap device. and I don't know in which state my system is when it has boot up (which hardware works and which not).

My Computer is now a bit older than 3 years and works with Win9x, Windows 2000 and several Linux Live Disributions, a 2.4 based Morphix (Debian based) and of course something like the SystemRescueCD with an 2.4 Kernel (Gentoo based) without any problems. So don't expect an general Hardware Problem other than perhaps a wrong parity setting (I have never find out which setting is totally correct and which of my drives need parity or which drive don't even provide it) – but no other driver seems to have a problem with my system. As far as I now, today you can disable parity at all. I think all my drives (mainly harddrives) which support parity shoud have it activated by the jumper setting anyway and also the Controller Bios should be set to support parity. I might check this if nesseccary, but this would force me do disassemble my comuter to have an look on the jumpers...

Sym53c8xx V2 seems to have problems with my /dev/sdb, which is an old IBM 4GB drive with 7000rpm and an 8-Bit Ultra SCSI Drive with an max. transfer rate of 20MB/s which I use as a swap drive for Windows 2000 and also for Linux (If it would work).

I hope you can find the Problem... Perhaps one of the boot parameters might solve the Problem, but I have not find something helpfull in the driver readme. I really want to say, as there are several people are affected, that this problem is urgent. Unfortunally I am not used in kernel and kernel driver programming, so I just able to apply patches and report success or failing.

With best regards

Danny Schneider

Dmesg with Original Gentoo Kernel

USB Controller: Intel Corp. 82801BA/BAM USB (Hub #2) (rev 1).

IRQ 9.

I/O at 0xa000 [0xa01f].

Bus 1, device 0, function 0:

VGA compatible controller: nVidia Corporation NV15 [GeForce2 GTS/Pro] (rev 163).

IRQ 11.

Master Capable. Latency=64. Min Gnt=5.Max Lat=1.

Non-prefetchable 32 bit memory at 0xee000000 [0xeeffff].

Prefetchable 32 bit memory at 0xf0000000 [0xf7ffff].

Bus 2, device 10, function 0:

Ethernet controller: 3Com Corporation 3c905C-TX/TX-M [Tornado] (rev 116).

IRQ 11.

Master Capable. Latency=32. Min Gnt=10.Max Lat=10.

I/O at 0xd800 [0xd87f].

Non-prefetchable 32 bit memory at 0xed800000 [0xed80007f].

Bus 2, device 11, function 0:

USB Controller: NEC Corporation USB (rev 67).

IRQ 9.

Master Capable. Latency=32. Min Gnt=1.Max Lat=42.

Non-prefetchable 32 bit memory at 0xed000000 [0xed000fff].

Bus 2, device 11, function 1:

USB Controller: NEC Corporation USB (#2) (rev 67).

IRQ 9.

Master Capable. Latency=32. Min Gnt=1.Max Lat=42.

Non-prefetchable 32 bit memory at 0xec800000 [0xec800fff].

Bus 2, device 11, function 2:

USB Controller: NEC Corporation USB 2.0 (rev 4).

IRQ 11.

Master Capable. Latency=32. Min Gnt=16.Max Lat=34.

Non-prefetchable 32 bit memory at 0xec000000 [0xec0000ff].

Bus 2, device 12, function 0:

SCSI storage controller: LSI Logic / Symbios Logic 53c895 (rev 1).

IRQ 9.

Master Capable. Latency=72. Min Gnt=30.Max Lat=64.

I/O at 0xd400 [0xd4ff].

Non-prefetchable 32 bit memory at 0xeb800000 [0xeb8000ff].

Non-prefetchable 32 bit memory at 0xeb000000 [0xeb000fff].

Bus 2, device 14, function 0:

Multimedia audio controller: Creative Labs SB Live! EMU10k1 (rev 8).

IRQ 11.

Master Capable. Latency=32. Min Gnt=2.Max Lat=20.

I/O at 0xd000 [0xd01f].

Bus 2, device 14, function 1:

Input device controller: Creative Labs SB Live! MIDI/Game Port (rev 8).

Master Capable. Latency=32.

I/O at 0xb800 [0xb807].

PCI: Using ACPI for IRQ routing
** PCI interrupts are no longer routed automatically. If this
** causes a device to stop working, it is probably because the
** driver failed to call pci_enable_device(). As a temporary
** workaround, the "pci=routeirq" argument restores the old
** behavior. If this argument makes the device work again,
** please email the output of "lspci" to bjorn.helgaas@hp.com
** so I can fix the driver.
